WAVE ENERGY UTILIZATION

António F. O. Falcão

Instituto Superior Técnico, Universidade Técnica de Lisboa

INTERNATIONAL PhD COURSE XXVII^o Cycle UNIVERSITY OF FLORENCE - TU-BRAUNSCHWEIG Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

Part 4 Technology

- Introduction.
- Energy Storage.
- PTO Equipment.
- Mooring

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

How far have we gone in 30+ yrs ? Some milestones:

1975- ... The early theoreticians

1991: EU <u>backs</u> up

wave energy

Introduction

The size

While, in other renewables, the power is more or less proportional to size/area,

... the power-versus-size relationship is much more complex for wave energy converters.

The concept of "point absorber" was introduced in Scandinavia around 1980 to describe efficient waveenergy absorption by well-tuned small devices.

Theoretically (in linear wave theory), energy from a regular wave of given frequency can be absorbed by a large oscillating body as well as from a small one, provided both are tuned.

The oscillation amplitude is larger for the smaller body.

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

Introduction

Wave energy absorption is widerbanded for a large body than for a "point-absorber".

This is relevant for **real polychromatic multi-frequency waves**.

Here smaller oscillating-bodies are less efficient than larger ones.

This can be (partially) overcome by control (phase control).

Introduction

Phase control, i.e. wave-to-wave control in radom waves, is one of the main issues in wave energy conversion.

Optimal control is a difficult theoretical control problem, that has been under investigation since the late 1970s.

Control is made difficult by the randomness of the waves and by the wave-device interaction being a process with memory.

The difficulty increases for multimode oscillations and for multibody systems.

Control should be regarded as an open problem and a major challenge in the development of wave energy conversion.

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

Introduction

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

Introduction

- A few basic concepts:
- Oscillating water column (OWC)
- "point absorber"
- large oscillating-body (multi-body)
- run-up device, ...

A large number of designs (>50) of which a few (≈15 ?) reached (or are close to) the prototype stage.

There are several effective ways of absorbing energy from the waves.

No technology appears to be dominant (unlike wind).

Slow convergence to a small number of basic designs ?

INTERNATIONAL PhD COURSE XXVII[°] Cycle UNIVERSITY OF FLORENCE - TU-BRAUNSCHWEIG Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

Like in life, will there be a Darwinian preservation of favoured wave energy converter designs in the struggle for the market?

How long will it take ? Which one(s) will be the **winner(s)** ?

Energy Storage

Solar energy (24h period) and tidal energy (12h25m period) are intermitent sources.

Wave energy is also intermitent, on a much shorter time scale (4-8 s).

Energy absorbed from real waves is very irregular with high peaks.

Electric power smoothing is required:

• to avoid large instantaneous overloading to equipment, especially electrical equipment (power electronics), or to reduce the rated-to-average power ratio of PTO.

to improve the quality of supplied electrical energy

This can be done with energy storage.

How to store energy ?

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

Energy Storage

How to store energy ?

Kinetic energy in <u>flywheel</u>:

• Air-turbine rotor (especially Wells type) in OWCs.

<u>Water reservoir</u> in overtopping devices:

• Tapchan, Wave Dragon, SSG.

Gas accumulator

Oscillating bodies with hydraulic (oil, water) power take-off.

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

Energy Storage

Typical power smoothing effect provided by a gas accumulator system. in an energetic sea state $H_s = 4m$.

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

Linear electric generator

- Used in AWS, heaving buoys.
- Direct conversion (no need for intermediate mechanisms)
- Fairly good overall efficiency (?)
- At prototype stage. Not commercially available.
- Cost ?
- Energy storage capacity: none or difficult to achieve (electrical capacitors).
- If no or little energy storage: high rated-to-average power ratio.

O. Danielsson, K. Thorburn, M. Leijon, "Direct drive – linear generators". In: Ocean Wave Energy (J. Cruz editor), Springer, 2008.

INTERNATIONAL PhD COURSE XXVII^o Cycle UNIVERSITY OF FLORENCE - TU-BRAUNSCHWEIG Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

PTO Equipment

Low-head hydraulic turbines

Used in Wave Dragon and other run-up converters.

- Conventional equipment (special design may be required).
- Good efficiency (about 90% at b.e.p.).
- Water reservoir provides energy storage.

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

PTO Equipment

High-head hydraulic turbines

In general of Pelton type

Used in Oyster, AquaBuoy, Hyperbaric WEC.

- An alternative to high-pressure oil.
- Conventional, high efficiency equipment.
- May require an air-accumulator energy storage system.

INTERNATIONAL PhD COURSE XXVII^o Cycle UNIVERSITY OF FLORENCE - TU-BRAUNSCHWEIG Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

PTO Equipment

High-pressure-oil PTO

- Used in, or proposed for, a large part of oscillating-body WECs.
- Unconventional use of mostly conventional equipment.
- Special designs may be desirable at later stages ? (S. Salter !)
- Fairly good efficiency (lower at partial loads).
- Gas accumulators may provide energy storage.
- Biodegradable oil may be required by environmental constraints.

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

PTO Equipment High-pressure-oil PTO LP gas HP gas accumulator accumulator **Buoy** **** **Motor Manifold** Cylinder

PTO Equipment

High-pressure-oil PTO

Pelamis

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

PTO Equipment

High-pressure-oil PTO

High-pressure accumulators

- Commercially available
- Bladder or piston types
- Gas: Nitrogen

Banks of unit required for full-sized WECs

Thermodynamics of gas in accumulator (isentropic process):

• pressure-volume $pV^{\gamma} = \text{constant}$

• pressure-temperature $p = \text{constant} \times T^{\gamma/(\gamma-1)}$

<u>energy storage</u> (internal energy)

$$\Delta U = C_{v} \Delta T$$

 $\gamma = 1.4$ for air and Nitrogen

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

PTO Equipment

High-pressure-oil PTO

Hydraulic motor

- Positive displacement machine.
- Max. power up to ~ 300 500 kW at > 1000 rpm.
- Direct drive of electric generator.
- Relatively compact.
- Variable displacement (double flow control capability).
- Fairly good efficiency at maximum flow.
- Reversible (as pump).
- Available from a few manufacturers.
- Not "too expensive".

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

The present situation:

- Several types competing (self-rectifying)
- Time-averaged efficiencies up to 50-65% ?

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

PTO Equipment

Air turbines

Wells turbine (mid-1970s)

- Several versions
- Used in most OWC prototypes

Impulse turbine (mid-1970s)

- Several versions
- Based on De Laval steam turbine (1889)
- Used in Indian prototype & CORES

Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

PTO Equipment Air turbines

Wells turbine

- Pico, Azores plant
- 400 kW
- single rotor
- D=2.3m
- with guide vanes

- OSPREY plant, UK
- 2×1 MW
- twin counterrotating rotors
- D=3.5m
- no guide vanes

- Sakata plant, Japan
- tandem Wells turbines
- 2 x 30 kW
- D=1.337m
- with guide vanes

INTERNATIONAL PhD COURSE XXVII[°] Cycle UNIVERSITY OF FLORENCE - TU-BRAUNSCHWEIG Processes, Materials and Constructions in Civil and Environmental Engineering Florence 18-19 April 2012

PTO Equipment

Air turbines

Impulse turbine

Main features:

- Relatively small diameter
- Relatively low rotational speed
- Less noisy
- Guide vanes are essential: fixed versus variable pitch guide vanes
- Maximum efficiency < Wells turbine
- Less sensitive to aerodynamic stalling
- Little energy storage capacity
- Has room for improvement

PTO Equipment

Mooring

• The mooring is primarily required to restrain the motion of the floater and ensure that it stays "on station" even under extreme environmental wave and current loadings.

• There can be significant differences in the requirements for the station keeping of a WEC, depending on the method that it uses to extract energy from the waves.

 Mooring can affect (in general negatively) the dynamics of the WEC.

 Mooring experience derives mostly from ships and offshore oildrilling platforms.

• Due to the reduced risks to human life, the factors of safety can be relaxed in the mooring design of a WEC to improve economic prospects.
